About me

I am a Computer Science student who is passionate about software development. I have the motivation to learn, collaborate effectively, and unleash creativity to create innovative applications. I am excited to contribute to a dynamic team and be part of creating cutting-edge solutions.

Bengkel Koding Web App E-learning

Front End Developer

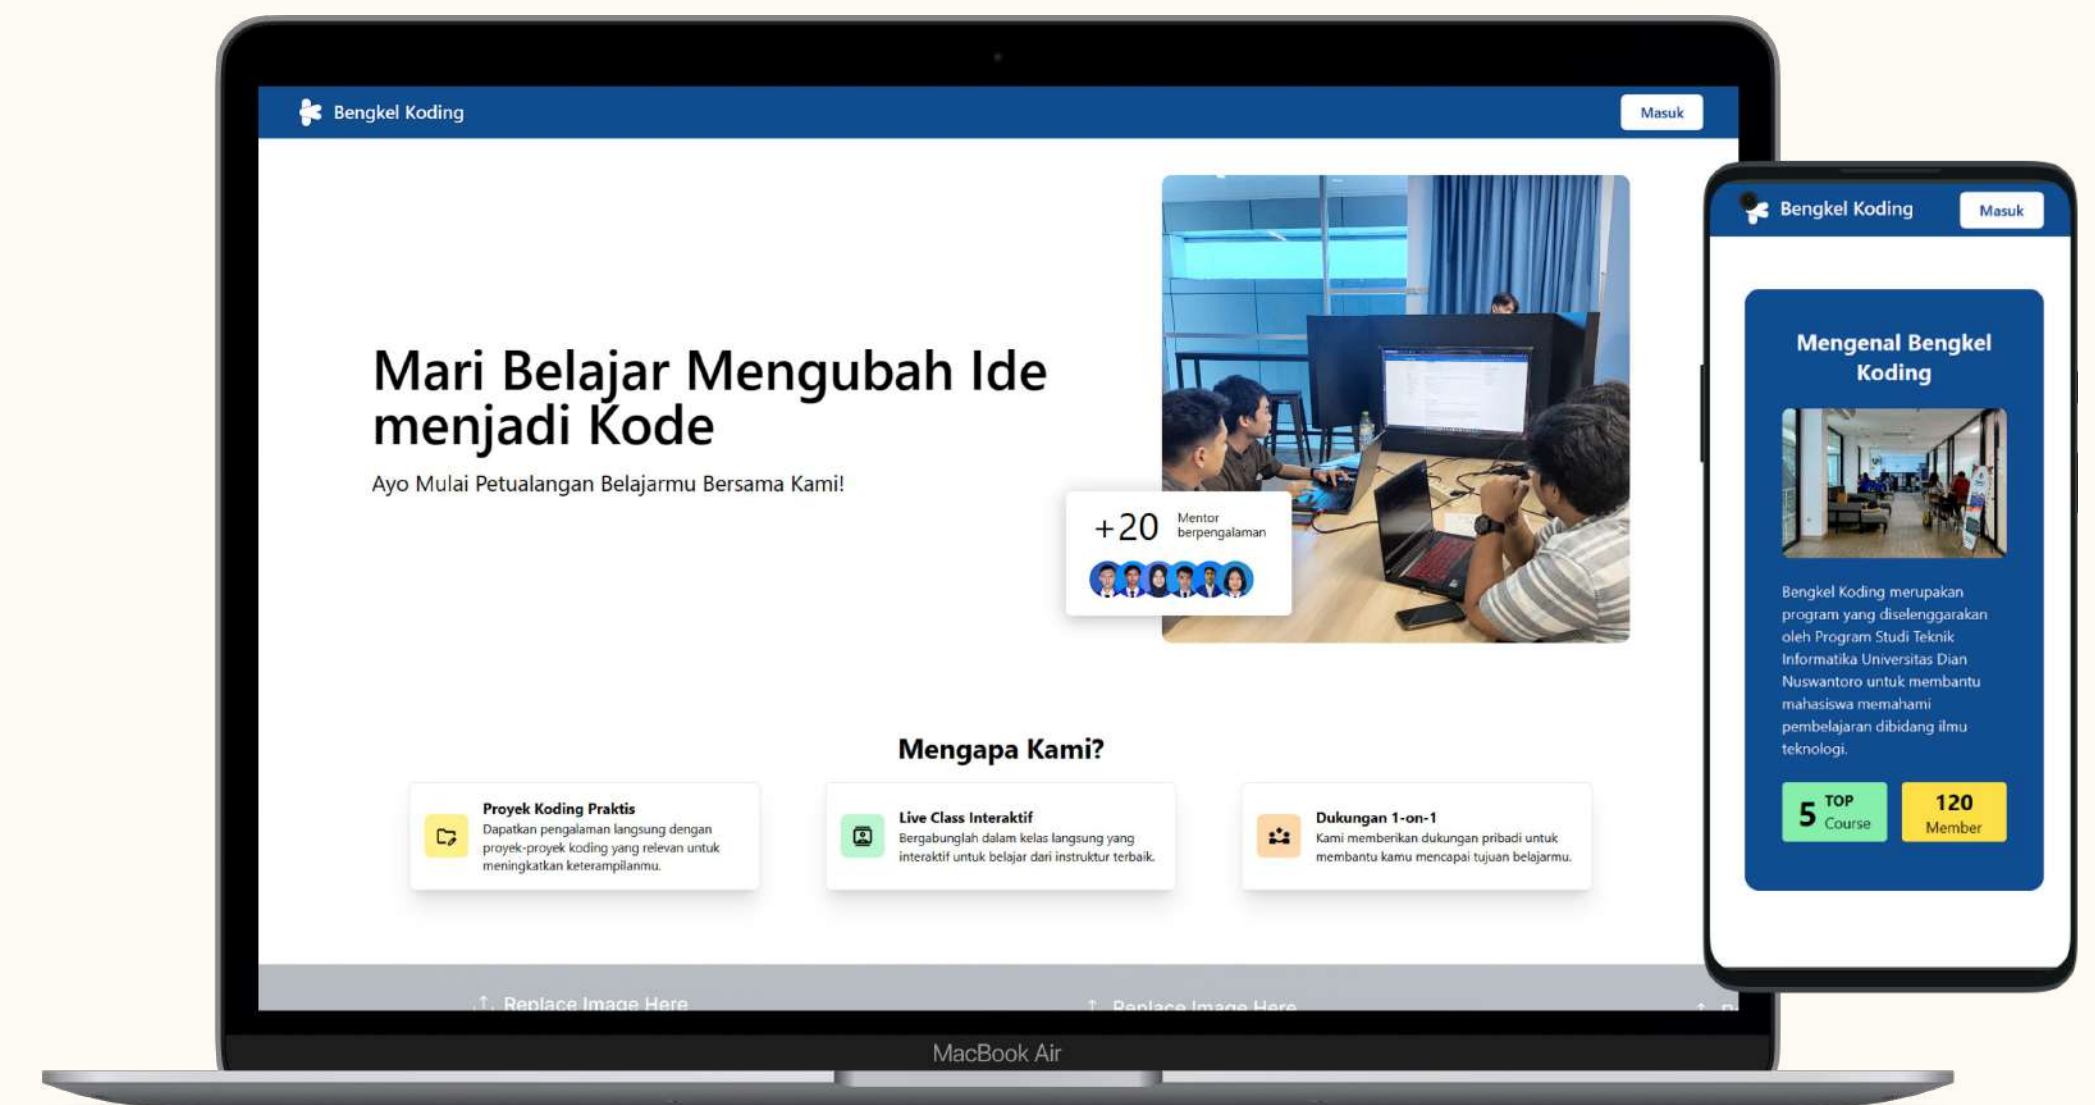

So far, this platform has registered **more than 300 students**, and the development team consists of 7 members. The main goal of this website is to provide access to students who take coding workshop courses to access courses based on their interests.

We are able to handle quite complex work in terms of system integration to team collaboration **using the SCRUM technique**. This project is a clear testament to the hard work and dedication of the entire team in creating solutions that benefit the academic community.

Muslim Center Al Kahfi

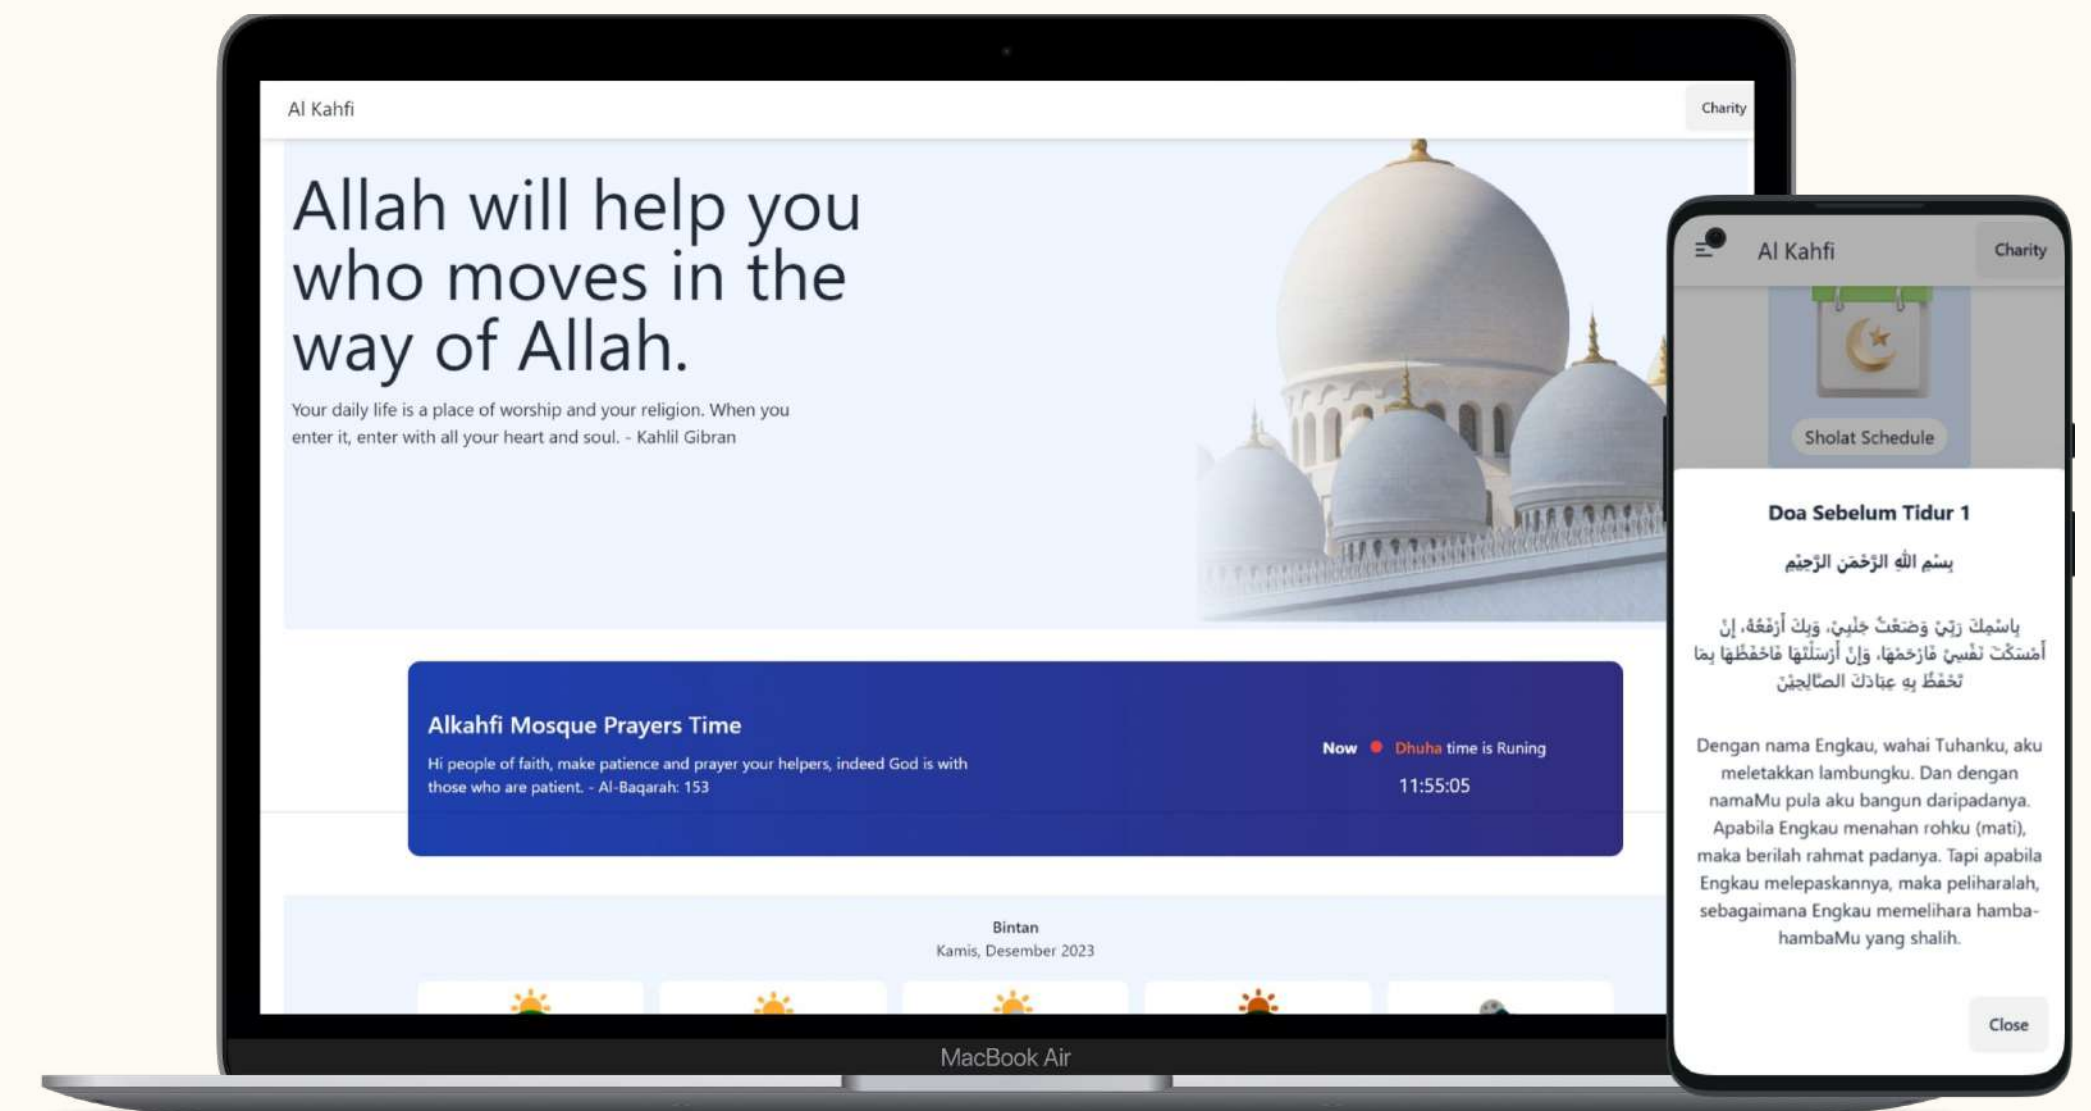

Full Developer

This project is an initiative of the Al Kahfi Muslim Center which focuses on **implementing API** for Prayer Schedules and Hadith. The main aim of this project is to provide instant and accurate access to essential religious information for Muslim pilgrims, so that they can access correct prayer times and read important hadiths.

While working on this project, **it was quite difficult to integrate different APIs**, integrating various APIs that provide prayer schedules and hadish with different formats and data structures. The way to deal with this is to create middleware that can normalize data from various APIs to ensure consistency and accuracy.

Kabarin News App

Full Developer

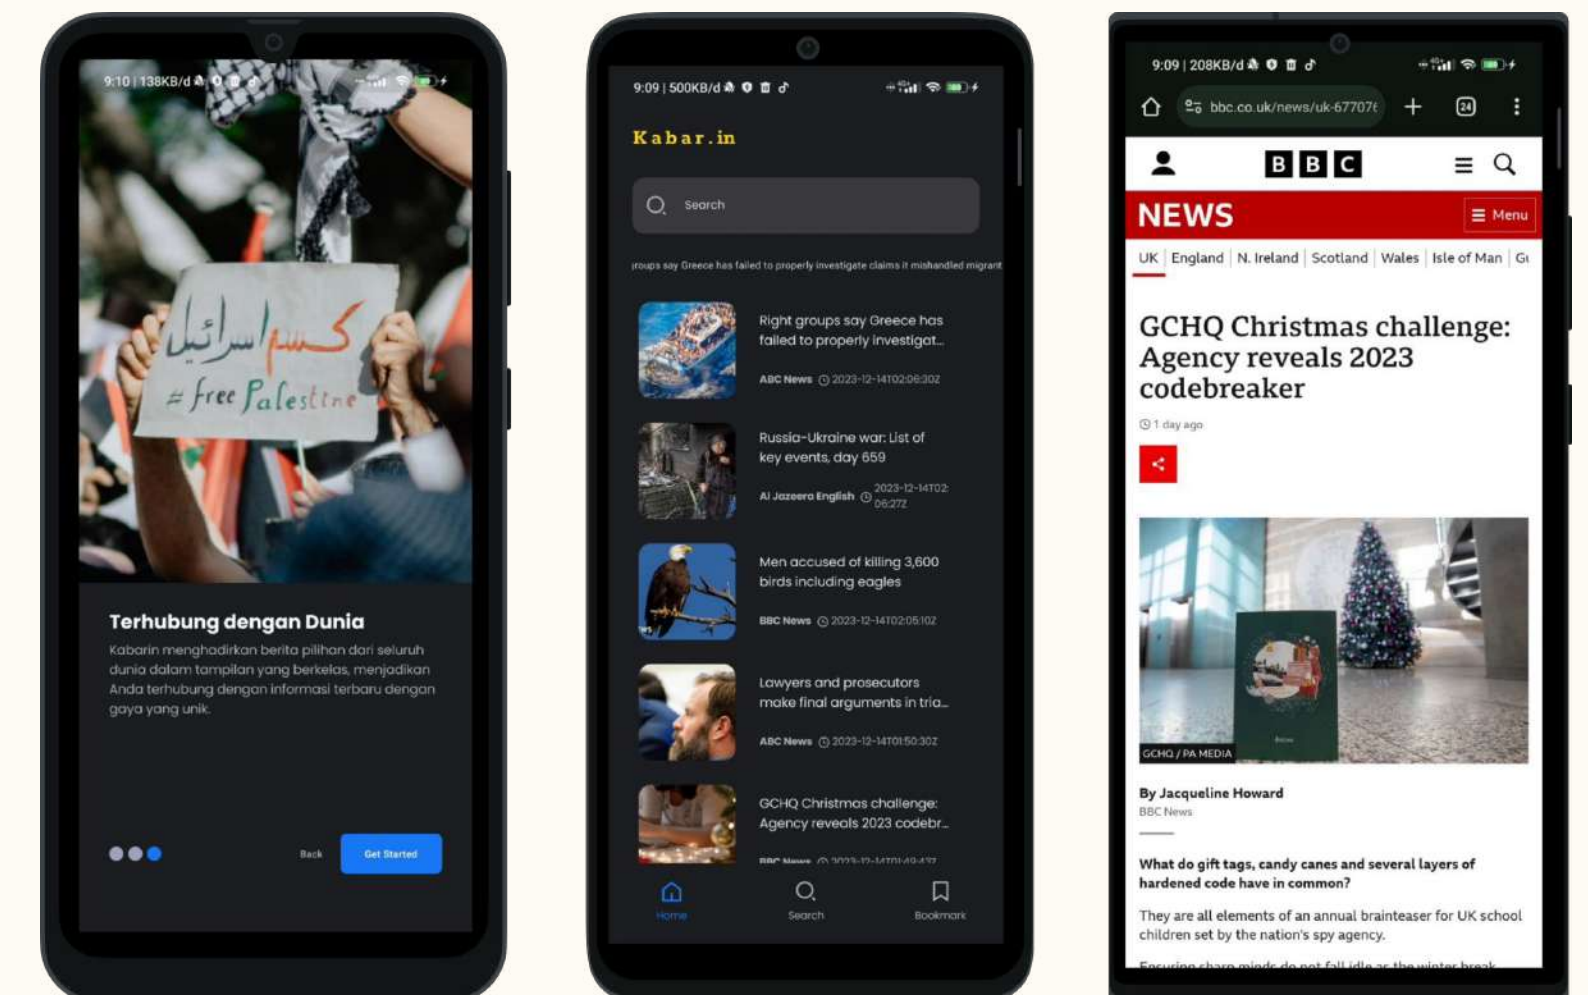

Kabarin is a personal project featuring **news reading, searching, and bookmarking features from the newsApi API**, using Kotlin and Jetpack Compose.

I faced obstacles due to lack of experience with Jetpack Compose and the concept of composable functions, which slowed down development.

To overcome this, I actively participated in learning path completion activities, read additional resources about Jetpack Compose, and asked questions during live sessions.

Kerja-in Todo Platform

Full Developer

Kerjain is a platform for recording activities with CRUD and storing data in local storage. Using ReactJS and Tailwind, this platform uses state in React to manage data.

The main obstacle is implementing CRUD with local storage. I solved it by reading the ReactJS and localstorage documentation and looking at some tutorials.

Masukin - Event Platform

Full Developer

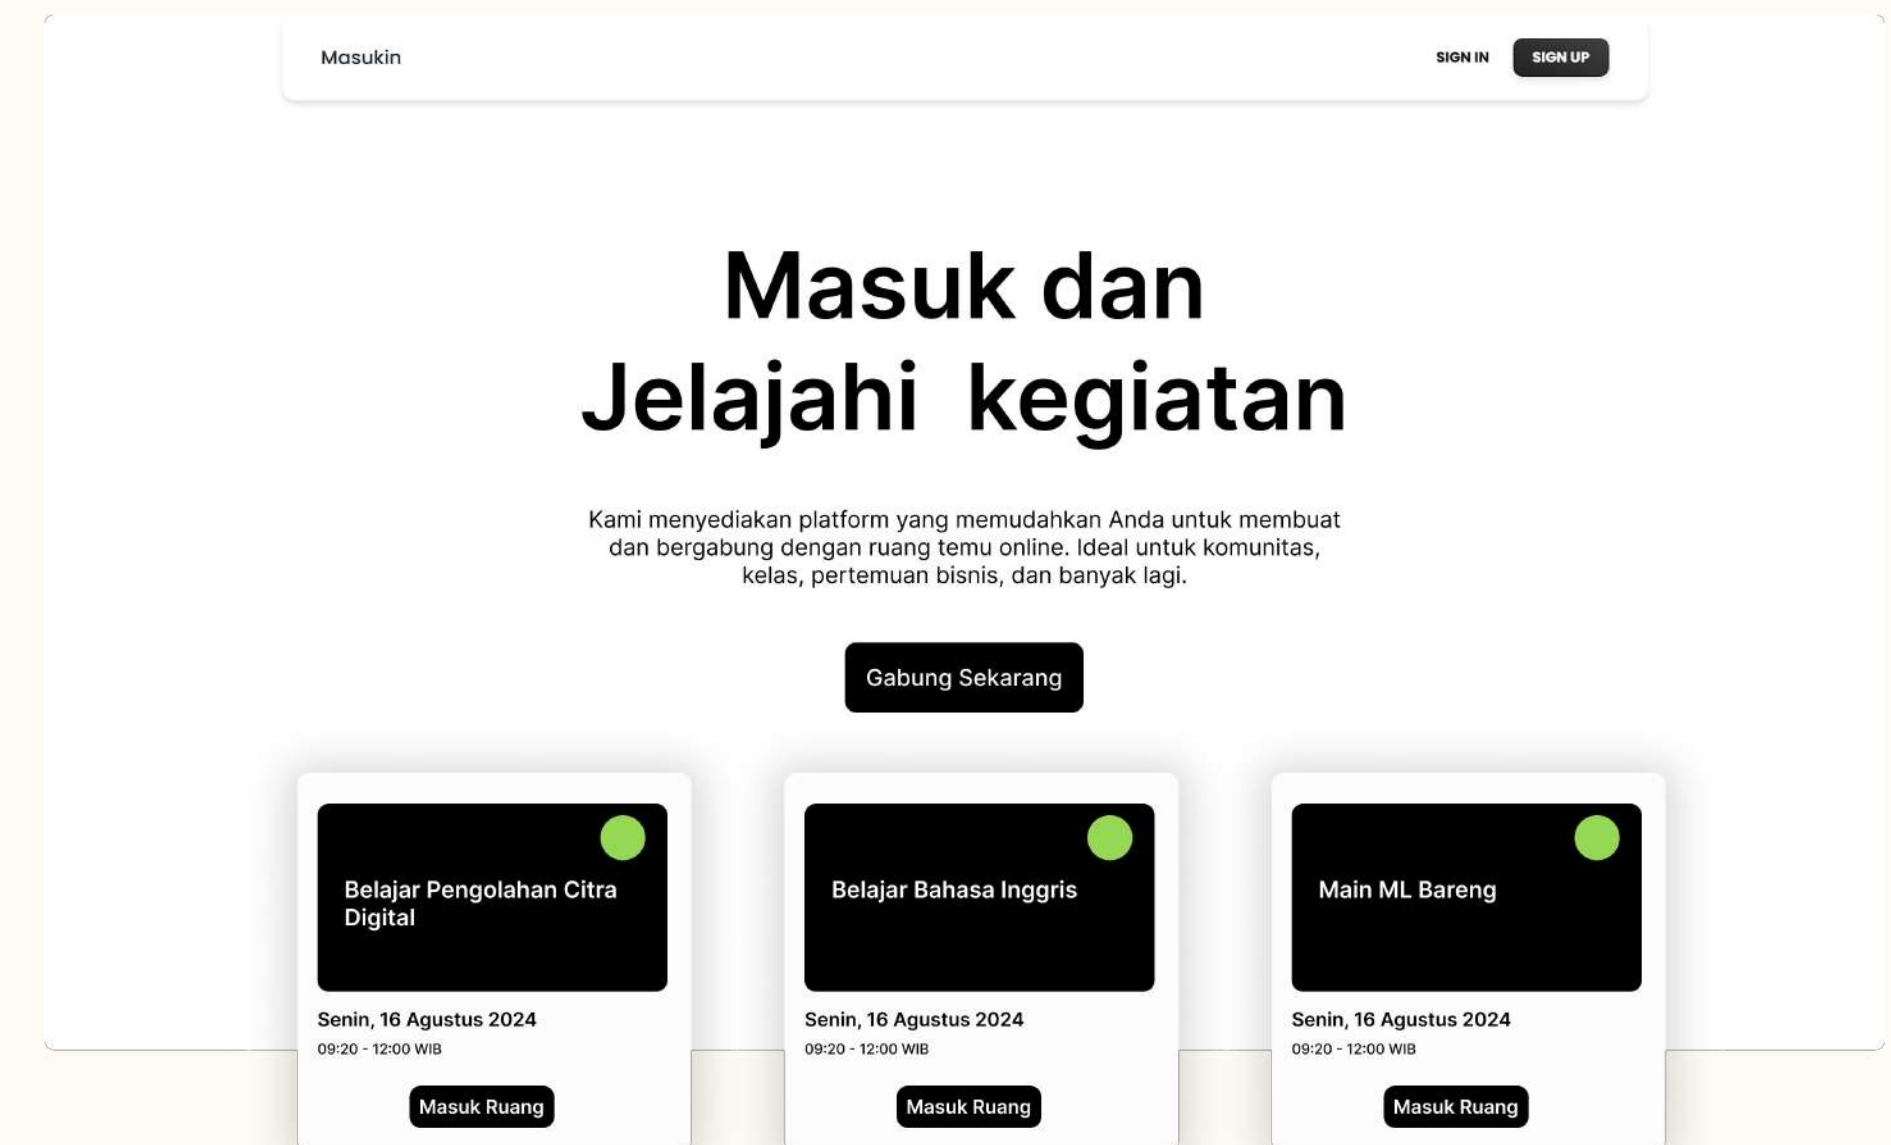

The **MASUKIN** platform makes it easy for users to join and share online meeting rooms. **Using MERN technology**, I focus on features that enrich the user experience.

The obstacle I'm facing is **integrating the backend with MongoDB** and connecting it to **the frontend using the Context API**. I solved this by ensuring the connection was working and using the Context API to manage state on the frontend.

Even though it is still in the development stage, MASUKIN has the potential to provide added value to users by providing an easily accessible online meeting space.

MARI

Mari-v1

Full Developer

Mari is a project aimed at **early detection of heart failure**, integrating with healthcare professionals and providing reports to local government on vulnerable populations.

Developed for the Samsung Innovation Campus competition, it utilizes IoT with ESP32 and pulse heart rate sensors, and plans to use Flutter for the mobile application.

This project aims to enhance healthcare by offering real-time monitoring and proactive reporting to improve response times and community health outcomes.
